

# Reactive Systems: Modelling, Specification and Verification

## EWSCS'07–Lecture 9

- Hennessy-Milner logic with recursively defined variables (continued)
- Game semantics
- Temporal properties of reactive systems

## Syntax of Formulae

Formulae are given by the following abstract syntax

$$F ::= X \mid tt \mid ff \mid F_1 \wedge F_2 \mid F_1 \vee F_2 \mid \langle a \rangle F \mid [a]F$$

where  $a \in Act$  and  $X$  is a distinguished variable with a definition

- $X \stackrel{\min}{=} F_X$ , or  $X \stackrel{\max}{=} F_X$

such that  $F_X$  is a formula of the logic (can contain  $X$ ).

## How Can We Define Semantics?

For every formula  $F$  we define a function  $O_F : 2^{Proc} \rightarrow 2^{Proc}$  s.t.

- if  $S$  is the set of processes that satisfy  $X$  then
- $O_F(S)$  is the set of processes that satisfy  $F$ .

## Syntax of Formulae

Formulae are given by the following abstract syntax

$$F ::= X \mid tt \mid ff \mid F_1 \wedge F_2 \mid F_1 \vee F_2 \mid \langle a \rangle F \mid [a]F$$

where  $a \in Act$  and  $X$  is a distinguished variable with a definition

- $X \stackrel{\min}{=} F_X$ , or  $X \stackrel{\max}{=} F_X$

such that  $F_X$  is a formula of the logic (can contain  $X$ ).

## How Can We Define Semantics?

For every formula  $F$  we define a function  $O_F : 2^{Proc} \rightarrow 2^{Proc}$  s.t.

- if  $S$  is the set of processes that satisfy  $X$  then
- $O_F(S)$  is the set of processes that satisfy  $F$ .

# Definition of $O_F : 2^{Proc} \rightarrow 2^{Proc}$ (let $S \subseteq 2^{Proc}$ )

$$O_X(S) = S$$

$$O_{tt}(S) = Proc$$

$$O_{ff}(S) = \emptyset$$

$$O_{F_1 \wedge F_2}(S) = O_{F_1}(S) \cap O_{F_2}(S)$$

$$O_{F_1 \vee F_2}(S) = O_{F_1}(S) \cup O_{F_2}(S)$$

$$O_{\langle a \rangle F}(S) = \langle a \cdot \rangle O_F(S)$$

$$O_{[a]F}(S) = [a \cdot] O_F(S)$$

$O_F$  is monotonic for every formula  $F$

$$S_1 \subseteq S_2 \Rightarrow O_F(S_1) \subseteq O_F(S_2)$$

Proof: Easy (by induction on the structure of  $F$ ).

# Definition of $O_F : 2^{Proc} \rightarrow 2^{Proc}$ (let $S \subseteq 2^{Proc}$ )

$$O_X(S) = S$$

$$O_{tt}(S) = Proc$$

$$O_{ff}(S) = \emptyset$$

$$O_{F_1 \wedge F_2}(S) = O_{F_1}(S) \cap O_{F_2}(S)$$

$$O_{F_1 \vee F_2}(S) = O_{F_1}(S) \cup O_{F_2}(S)$$

$$O_{\langle a \rangle F}(S) = \langle a \cdot \rangle O_F(S)$$

$$O_{[a]F}(S) = [a \cdot] O_F(S)$$

$O_F$  is monotonic for every formula  $F$

$$S_1 \subseteq S_2 \Rightarrow O_F(S_1) \subseteq O_F(S_2)$$

Proof: Easy (by induction on the structure of  $F$ ).

## Observation

We know  $O_F$  is **monotonic**, so  $O_F$  has a unique **greatest and least fixed point**.

## Semantics of the Variable $X$

- If  $X \stackrel{\max}{=} F_X$  then

$$\llbracket X \rrbracket = \bigcup \{S \subseteq Proc \mid S \subseteq O_{F_X}(S)\}.$$

- If  $X \stackrel{\min}{=} F_X$  then

$$\llbracket X \rrbracket = \bigcap \{S \subseteq Proc \mid O_{F_X}(S) \subseteq S\}.$$

# Game Characterization

Intuition: the attacker claims  $s \not\models F$ , the defender claims  $s \models F$ .

Configurations of the game are of the form  $(s, F)$

- $(s, tt)$  and  $(s, ff)$  have no successors
- $(s, X)$  has one successor  $(s, F_X)$
- $(s, F_1 \wedge F_2)$  has two successors  $(s, F_1)$  and  $(s, F_2)$   
(selected by the attacker)
- $(s, F_1 \vee F_2)$  has two successors  $(s, F_1)$  and  $(s, F_2)$   
(selected by the defender)
- $(s, [a]F)$  has successors  $(s', F)$  for every  $s'$  s.t.  $s \xrightarrow{a} s'$   
(selected by the attacker)
- $(s, \langle a \rangle F)$  has successors  $(s', F)$  for every  $s'$  s.t.  $s \xrightarrow{a} s'$   
(selected by the defender)

# Who is the Winner?

**Play** is a maximal sequence of configurations formed according to the rules given on the previous slide.

## Finite Play

- The **attacker** is the winner of a finite play if the defender gets stuck or the players reach a configuration  $(s, ff)$ .
- The **defender** is the winner of a finite play if the attacker gets stuck or the players reach a configuration  $(s, tt)$ .

## Infinite Play

- The **attacker** is the winner of an infinite play if  $X$  is defined as  $X \stackrel{\min}{=} F_X$ .
- The **defender** is the winner of an infinite play if  $X$  is defined as  $X \stackrel{\max}{=} F_X$ .

# Who is the Winner?

**Play** is a maximal sequence of configurations formed according to the rules given on the previous slide.

## Finite Play

- The **attacker** is the winner of a finite play if the defender gets stuck or the players reach a configuration  $(s, ff)$ .
- The **defender** is the winner of a finite play if the attacker gets stuck or the players reach a configuration  $(s, tt)$ .

## Infinite Play

- The **attacker** is the winner of an infinite play if  $X$  is defined as  $X \stackrel{\min}{=} F_X$ .
- The **defender** is the winner of an infinite play if  $X$  is defined as  $X \stackrel{\max}{=} F_X$ .

## Theorem

- $s \models F$  if and only if the defender has a universal winning strategy from  $(s, F)$
- $s \not\models F$  if and only if the attacker has a universal winning strategy from  $(s, F)$

# Selection of Temporal Properties

- $Inv(F)$ :  $X \stackrel{\max}{\equiv} F \wedge [Act]X$
- $Pos(F)$ :  $X \stackrel{\min}{\equiv} F \vee \langle Act \rangle X$
- $Safe(F)$ :  $X \stackrel{\max}{\equiv} F \wedge ([Act]ff \vee \langle Act \rangle X)$
- $Even(F)$ :  $X \stackrel{\min}{\equiv} F \vee (\langle Act \rangle tt \wedge [Act]X)$
- $F U^w G$ :  $X \stackrel{\max}{\equiv} G \vee (F \wedge [Act]X)$
- $F U^s G$ :  $X \stackrel{\min}{\equiv} G \vee (F \wedge \langle Act \rangle tt \wedge [Act]X)$

Using until we can express e.g.  $Inv(F)$  and  $Even(F)$ :

$$Inv(F) \equiv F U^w ff$$

$$Even(F) \equiv tt U^s F$$

# Selection of Temporal Properties

- $Inv(F)$ :  $X \stackrel{\max}{\equiv} F \wedge [Act]X$
- $Pos(F)$ :  $X \stackrel{\min}{\equiv} F \vee \langle Act \rangle X$
- $Safe(F)$ :  $X \stackrel{\max}{\equiv} F \wedge ([Act]ff \vee \langle Act \rangle X)$
- $Even(F)$ :  $X \stackrel{\min}{\equiv} F \vee (\langle Act \rangle tt \wedge [Act]X)$
- $F U^w G$ :  $X \stackrel{\max}{\equiv} G \vee (F \wedge [Act]X)$
- $F U^s G$ :  $X \stackrel{\min}{\equiv} G \vee (F \wedge \langle Act \rangle tt \wedge [Act]X)$

Using until we can express e.g.  $Inv(F)$  and  $Even(F)$ :

$$Inv(F) \equiv F U^w ff$$

$$Even(F) \equiv tt U^s F$$

# Selection of Temporal Properties

- $Inv(F)$ :  $X \stackrel{\max}{\equiv} F \wedge [Act]X$
- $Pos(F)$ :  $X \stackrel{\min}{\equiv} F \vee \langle Act \rangle X$
- $Safe(F)$ :  $X \stackrel{\max}{\equiv} F \wedge ([Act]ff \vee \langle Act \rangle X)$
- $Even(F)$ :  $X \stackrel{\min}{\equiv} F \vee (\langle Act \rangle tt \wedge [Act]X)$
- $F U^w G$ :  $X \stackrel{\max}{\equiv} G \vee (F \wedge [Act]X)$
- $F U^s G$ :  $X \stackrel{\min}{\equiv} G \vee (F \wedge \langle Act \rangle tt \wedge [Act]X)$

Using until we can express e.g.  $Inv(F)$  and  $Even(F)$ :

$$Inv(F) \equiv F U^w ff$$

$$Even(F) \equiv tt U^s F$$

# Selection of Temporal Properties

- $Inv(F)$ :  $X \stackrel{\max}{\equiv} F \wedge [Act]X$
- $Pos(F)$ :  $X \stackrel{\min}{\equiv} F \vee \langle Act \rangle X$
- $Safe(F)$ :  $X \stackrel{\max}{\equiv} F \wedge ([Act]ff \vee \langle Act \rangle X)$
- $Even(F)$ :  $X \stackrel{\min}{\equiv} F \vee (\langle Act \rangle tt \wedge [Act]X)$
- $F \mathcal{U}^w G$ :  $X \stackrel{\max}{\equiv} G \vee (F \wedge [Act]X)$
- $F \mathcal{U}^s G$ :  $X \stackrel{\min}{\equiv} G \vee (F \wedge \langle Act \rangle tt \wedge [Act]X)$

Using until we can express e.g.  $Inv(F)$  and  $Even(F)$ :

$$Inv(F) \equiv F \mathcal{U}^w ff$$

$$Even(F) \equiv tt \mathcal{U}^s F$$

# Examples of More Advanced Recursive Formulae

## Nested Definitions of Recursive Variables

$$X \stackrel{\min}{=} Y \vee \langle \text{Act} \rangle X \qquad Y \stackrel{\max}{=} \langle a \rangle tt \wedge \langle \text{Act} \rangle Y$$

**Solution:** Compute first  $\llbracket Y \rrbracket$  and then  $\llbracket X \rrbracket$ .

## Mutually Recursive Definitions

$$X \stackrel{\max}{=} [a]Y \qquad Y \stackrel{\max}{=} \langle a \rangle X$$

**Solution:** Consider the complete lattice  $(2^{\text{Proc}} \times 2^{\text{Proc}}, \sqsubseteq)$  where  $(S_1, S_2) \sqsubseteq (S'_1, S'_2)$  iff  $S_1 \subseteq S'_1$  and  $S_2 \subseteq S'_2$ .

## Theorem (Characteristic Property for Finite-State Processes)

Let  $s$  be a process with finitely many reachable states. There exists a property  $X_s$  s.t. for all processes  $t$ :  $s \sim t$  if and only if  $t \in \llbracket X_s \rrbracket$ .

# Examples of More Advanced Recursive Formulae

## Nested Definitions of Recursive Variables

$$X \stackrel{\min}{=} Y \vee \langle \text{Act} \rangle X \qquad Y \stackrel{\max}{=} \langle a \rangle tt \wedge \langle \text{Act} \rangle Y$$

**Solution:** Compute first  $\llbracket Y \rrbracket$  and then  $\llbracket X \rrbracket$ .

## Mutually Recursive Definitions

$$X \stackrel{\max}{=} [a]Y \qquad Y \stackrel{\max}{=} \langle a \rangle X$$
